AI Lead Recovery & Booking System for Contractors

Product Case Study | **Gbemisola Christiana Agboola**

ROLE	STATUS	FOCUS	MARKET
Founder / GTM & Automation Builder	Prototype	Lead recovery + booking	Roofing contractors

Zunmera's landing page frames the product around preventing roofing leads from being lost to slow follow-up.

01 The Business Problem

Roofing businesses can lose potential jobs when new enquiries are not responded to or followed up quickly. Contractors may be on-site when a homeowner reaches out, while lead information can become scattered across calls, messages, email or spreadsheets. Zunmera is designed to keep each enquiry visible and moving toward an outcome.

02 The Product

Zunmera is a contractor lead-recovery prototype that captures incoming enquiries and moves them through qualification and booking. **Conversational automation assists the homeowner, while backend rules retain control of qualification state, escalation, availability and booking.**

HOW THE WORKFLOW RUNS

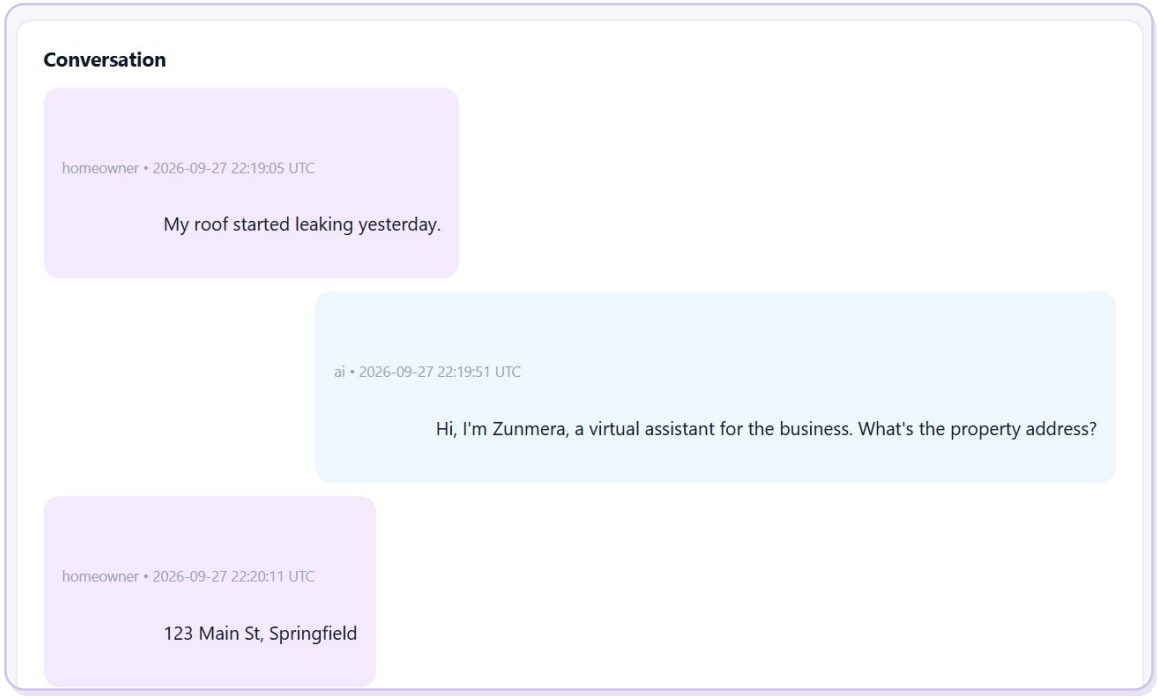

ENQUIRY › CONVERSATION › QUALIFY › AVAILABILITY › BOOK › DASHBOARD

03 End-to-End Workflow

1 Conversation

STEP 1 OF 4

The homeowner reports a roofing problem and Zunmera begins collecting the information needed to progress the lead.

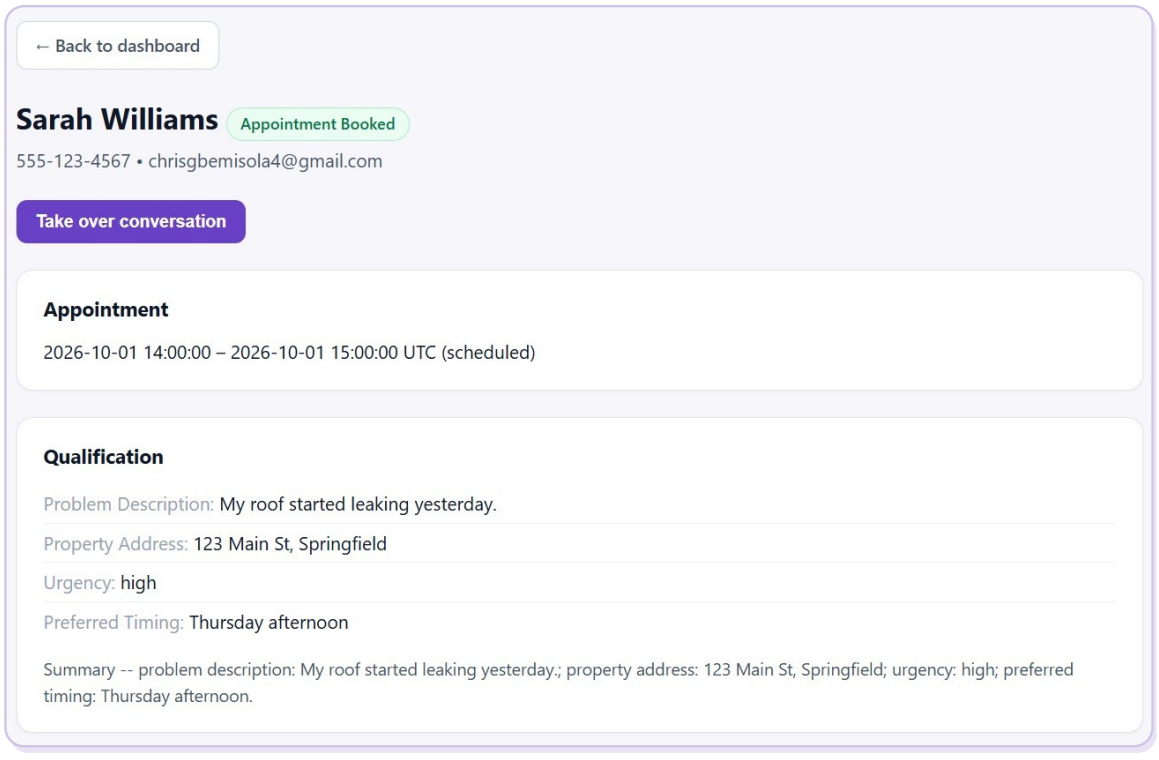

What to notice: the assistant introduces itself as a virtual assistant and asks for the property address.

2 Qualification

STEP 2 OF 4

The contractor view records the problem, address, urgency and preferred timing alongside the appointment.

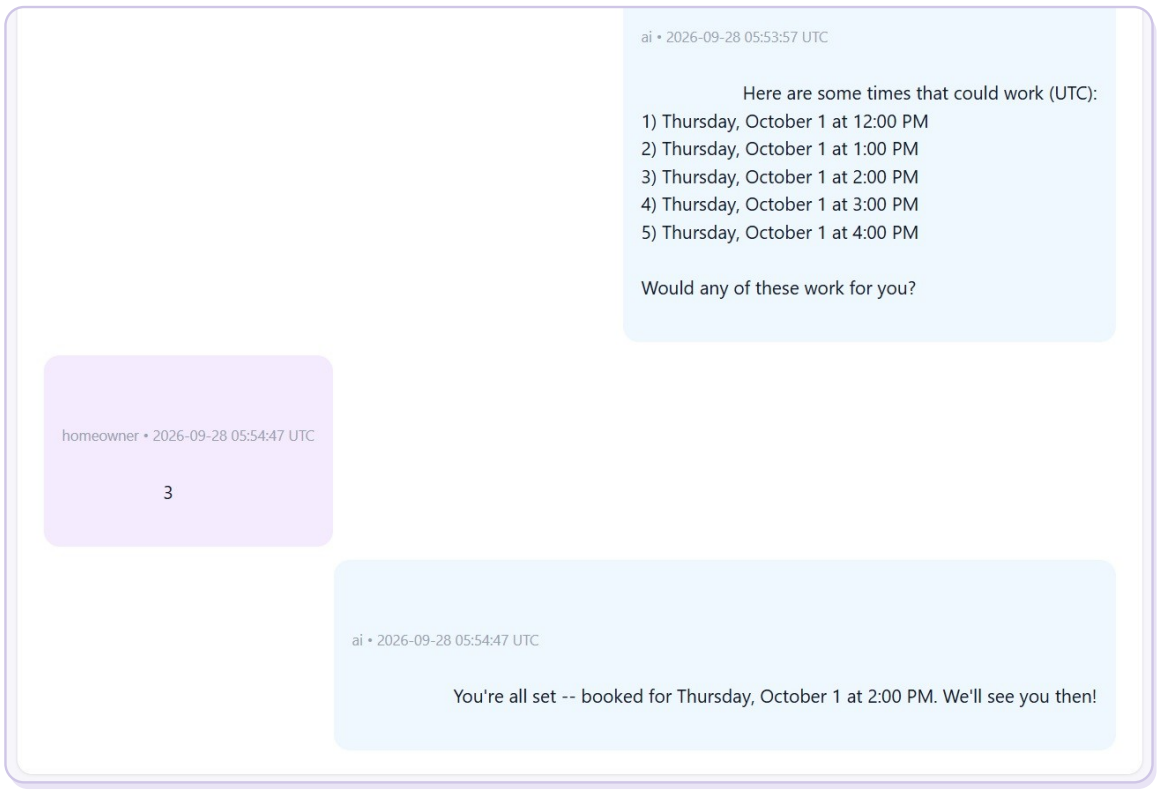

What to notice: problem, address, urgency and timing are recorded against the lead, and a *Take over conversation* control is available to the contractor.

3 Booking

STEP 3 OF 4

Available time options are offered and the selected appointment is confirmed.

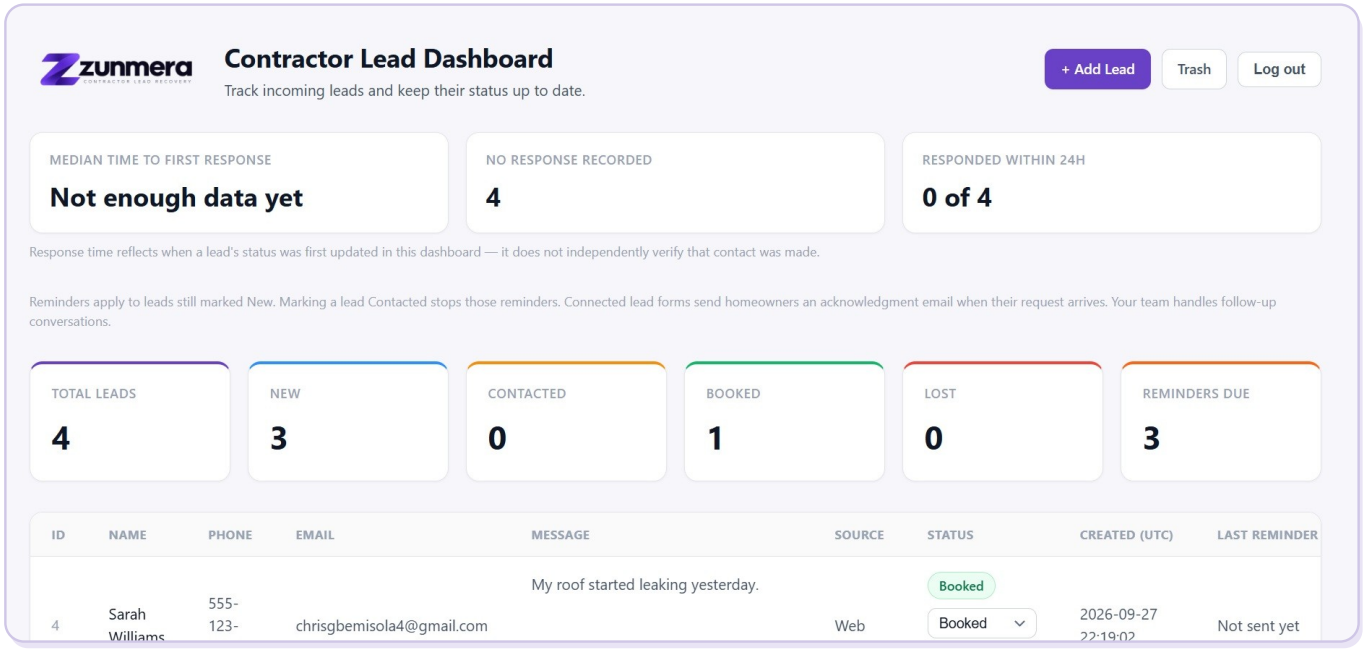

What to notice: five time options are offered, the homeowner replies “3”, and the booking is confirmed for Thursday, October 1 at 2:00 PM.

4 Dashboard

STEP 4 OF 4

The contractor can see lead status, booked outcomes and reminders in one place.

What to notice: lead counts by status, reminders due and response-time figures in one view. The dashboard notes that response time reflects when a lead's status was first updated and does not independently verify contact.

04 My Contribution

01 Mapped the lead journey from incoming enquiry through qualification, availability and appointment booking.

02 Built the Flask-based application with persistent lead/conversation data, contractor views and status tracking.

03 Designed human takeover so a contractor can intervene when automation should not continue alone.

04 Implemented backend-controlled qualification, escalation and booking rules instead of allowing model output to authorize critical actions.

05 Added follow-up/reminder logic, security controls and regression tests around the workflow.

06 Worked across product positioning, workflow design, UI decisions, implementation and testing using AI-assisted development.

05 GTM / Revenue Thinking

The project started from a revenue workflow, not from an AI feature. The target problem is missed or slow contractor follow-up: a homeowner has already shown intent, but the opportunity can disappear before the business responds. Zunmera is structured to keep that lead visible and moving toward a booked outcome.

01
Capture
Bring incoming enquiries into a consistent workflow.

02
Convert
Qualify intent and move it toward an appointment.

03
Control
Keep contractor visibility and human intervention available.

06 Technical Approach

STACK

Python | Flask | HTML/CSS/JavaScript | SQLite/Turso | APIs | Vercel | Git/GitHub

Development: AI-assisted implementation with backend safeguards, automated tests and synthetic test data.

Qualification updates are validated before being applied.

Slot selection is resolved server-side so ambiguous or invented choices cannot authorize a booking.

Provider failures are sanitized and critical state changes remain backend-owned.

Conversation context is bounded and the test environment is isolated from real network calls.

07 Current Stage & Boundaries

PROTOTYPE Zunmera is currently a prototype, built and tested using synthetic lead data.

BUILT & TESTED (SYNTHETIC LEAD DATA)

- ✓ **Lead capture**
- ✓ **Qualification**
- ✓ **Booking**
- ✓ **Dashboard**
- ✓ **Follow-up**
- ✓ **Human takeover**

- ✓ AI-provider integration has been **architected and tested**.

NOT CLAIMED IN THIS CASE STUDY

- ✗ **Live LLM operation**
- ✗ **Real customers**
- ✗ **Revenue**
- ✗ **Live Google Calendar integration**

This case study does not claim live LLM operation, real customers, revenue, or a live Google Calendar integration.

08 Relevance to GTM Engineering

Zunmera sits at the intersection of business process design and technical implementation. **It demonstrates my approach to a revenue problem:** identify where a lead can be lost, design the workflow that should happen instead, build the automation, preserve human control, and expose the outcome in a system the business can use.
